

STARGAZER-QD IMAGE MODES

IMAGE MODES IN DAYLIGHT & NIGHTTIME

In daylight, the color enhancing filter is activated.
Choose daytime color mode for brilliant color rendition.

At nighttime, once the IR is activated, the color filter is
automatically disconnected to allow IR light inside the sensor.

Our unique **Ultra Night Vision Mode** allows use of
binocular in the dark with IR off at short distances.

When IR is activated, or when **Ultra Night Vision Mode** is on, choose either
Low-Light Color Mode, or a variety of monochrome image colors like
Black & White, NV Green Phosphor, NV White Phosphor and Amber.
